

Óbuda University <i>Donát Bánki Faculty of Mechanical and Safety Engineering</i>		Institute of Mechatronics and Vehicle Engineering		
Subject name and Neptun-code: Automatic Control Systems (BGRIR14NEC)				Credit points of the Subject: 4
<i>Full time training. 1st Semester of the Academic year of 2015/16.</i>				
The course is available at: BSc in Mechatronics.				
Supervised by:	Prof. Dr. SZABOLCSI, Róbert		Lectured by:	Prof. Dr. SZABOLCSI, Róbert
Requirements of the course: (Neptun Codes)	—			
Lessons per week:	Theory: 2	Practice (in Auditorium): 0	Lab: 2	Consultation: 0
Level of exam (s,v,f):	V (Exam)			
The Syllabus				
<i>Aim:</i> Give an overview about modern control systems, systems' analysis and preliminary design.				
<i>Topics:</i> Basics of automatic control theory. Modern control theory. Mathematical models of dynamical systems. Laplace-transformation used in control theory. State-space representation of dynamical systems. Block diagrams, signal flow charts. Basic terms and their analysis. Time domain responses. Frequency domain responses. Open loop system analysis. Closed loop system analysis. Reference signal tracking problems. Disturbance rejection and sensor noise attenuation problems, and their solution in control engineering. Stability problems of the closed loop control systems. Main elements of the control engineering, and their dynamical description. Dynamic performances used in control engineering. Control system preliminary design: pole placement, LQ-based design methods. Solution of control problems of control engineering using MATLAB.				
Requirements				
Weeks				
2.	Basics of automatic control theory. Modern control theory. Mathematical models of dynamical systems. Basics in MATLAB Programming.			
3. – 4.	Laplace-transformation used in control theory. State-space representation of dynamical systems. Block diagrams, signal flow charts. Basic terms and their analysis. Time domain responses. Frequency domain responses. Open loop system analysis. Solution of control problems using MATLAB.			
5.	Test paper No 1.			
6.-7.	Closed loop system analysis. Reference signal tracking problems. Disturbance rejection and sensor noise attenuation problems, and their solution in control engineering. Stability problems of the closed loop control systems. Main elements of the control engineering, and their dynamical description. Solution of control problems of mechatronics using MATLAB.			
8.	Test paper No 2.			
9.–13.	Dynamic performances used in control engineering. Control system preliminary design: pole placement, LQ-based design methods. Solution of control problems of control engineering using MATLAB. Analogue and digital devices used in control engineering. Solution of control problems of mechatronics using MATLAB.			
14.	Test paper No 3.			
15.	Closing the Course. Subject grades.			
All main areas of the course are evaluated by test papers. The course is to be considered successfully executed if and only if all the 3 test papers are marked with grades higher than 2 (satisfactory). If there is any test paper evaluated by grade of "Unsatisfactory (Grade 1)" of those all 3 written test papers, the teacher's signature is refused. If there is a single test paper not written one, the student must be cleared from the course.				
<i>To improve:</i> If there is any unsatisfactory evaluated test paper, the student must be provided 2 occasions to improve including the 15 th lecture.				
<i>Participation:</i> The participation is not obligatory at all lectures with the exemption of the test paper lectures.				
<i>Grade:</i> The teacher's signature is provided and student can apply for the exam if and only if the average grade of three test papers is higher than 2.
